

Electrical Supply Requirements for the Brautag Premium Brewing System

The Brautag three vessel system uses a 220/240 NEMA 14-30 style plug. This is the same plug that is currently used for clothes dryers in most new home construction, so they are readily available. The minimum size wire for this plug is 10 gauge, but it might need a larger wire for longer runs. Be sure to check local electrical loads or consult with your local licensed electrician.

Keep in mind that although the Brautag system uses both 220/240 and 110/120 electrical supply to run the 5500 Watt elements and the pumps, this is all done in the control box so you only need to supply this single plug.

Here are some photographs of a NEMA 14-30 plug in two styles.

- A qualified electrician should install this plug/receptacle.
- Make sure all national and local electrical codes are followed.
